```
1: # Anthony Tesoriero, Joseph Salemo, Joshua Lunsk, October 9 2019, Beginner Assignment
2: # Write a program that will read two numbers and will compute the sum of those two numbers.
3: # (If you are working in a functional language, you may write a function that takes two numbers
4: # as input parameters and returns the sum of the two numbers.)
5:
6: print("The sum of the two numbers is " + str(
7:     float(input("What is the first number? ")) +
8:     float(input("What is the second number? "))))
```

Output

———————————————————————

Run 1:

What is the first number? 7
What is the second number? 5
The sum of the two numbers is 12.0

Process finished with exit code 0

———————————————————————

Run 2:

What is the first number? 8.25
What is the second number? 264.9472
The sum of the two numbers is 273.1972

Process finished with exit code 0
